

Perioperative NAD+

IV infusions at home Before and After Surgery

NAD+ is a biomolecule found in every cell in your body. It is required for cellular repair and energy production. Aging, stress, and dietary deficiency can deplete NAD+ levels.

Surgery creates significant stress on the body.

Following his own surgical experience, Dr. Workman created the Perioperative NAD+ Protocol to help reduce post-operative pain and support a more rapid return of mobility and function. NAD+ infusions accelerate tissue healing by supporting mitochondrial function.

BENEFITS

- ✓ Reduced Pain
- ✓ Decreased Inflammation
- ✓ Reduced Fatigue
- ✓ Decreased Downtime
- ✓ Increased Healing
- ✓ Improved Function
- ✓ Increased Mobility
- ✓ Immunity / Energy

WHAT TO EXPECT

Receive infusions in the comfort of your own home. An experienced infusion nurse comes to your home or workplace a few days before your procedure to administer two daily infusions. After surgery, you receive two more infusions within four days to support recovery.
